

# Ventilating and Bleed Valve Type 591 and Ventilating Valve Type 595

Type 591 (without spring)

Type 595 (with spring)

## Product description

Ventilating and bleed valves can emit gases from containers and piping systems and vacuums can be avoided by supplying air - automatically and without using external energy. Types 595 and 591 fit all common plastic piping systems thanks to an extensive assortment.

### Function

#### Type 591 function

Bleeding when filling, venting when draining. Depending on the filling rate, the float is raised by the rising fluid level. Simultaneously, the gases are removed from the system through the valve. When the pipe is completely filled, the float is pressed into the profile gasket and closes the valve.

#### Type 595 function

Ventilating when draining. The ventilating Valve Type 595 was developed especially for the ventilation process and is used when a safe and controlled supply of air must be guaranteed. This prevents gases/liquids from being emitted into the surroundings. The cone is continuously pressed into the profile seal and does not open until a vacuum is created in the pipe or container.

### Applications

- Microelectronics
- Chemical process industry
- Food and beverages
- Water treatment
- Cooling processes

### Advantages

- Self-acting bleeding and venting
- No auxiliary energy required for operation
- Wide range of materials for optimum chemical resistance
- Complete and reliable bleeding of the piping system
- Controlled supply of air
- High efficiency and precision

## Characteristics

### Safety

The new valve of types 591 and 595 control the venting and bleeding of piping systems and tanks with high precision and completely reliably. They contribute significantly to the safety and protection of your system, for example by avoiding the unwanted buildup of a vacuum when emptying piping systems and tanks.

### Simplicity

The valves are impressive by virtue of their simple installation and are practically maintenance-free. This is a result of their compact construction and innovative details of their construction, which are designed for safety, ergonomics and efficiency.

### Flexibility

The many different dimensions and optimal sizes allow the valves to be used under almost all space conditions and in any system design. The valves are positioned at the absolute or temporary high points in the system, after pumps and at turning points.

### Flow media

Media that are free of foreign particles, viscous, thick and gaseous media.

## Technical data

- ① Protection cap
- ② Coupling nut
- ③ Spigot
- ④ O-ring
- ⑤ Screw-in ring
- ⑥ Sealing ring
- ⑦ Back-up ring
- ⑧ Float
- ⑨ Spring (Type 595)
- ⑩ Housing
- ⑪ Connecting part

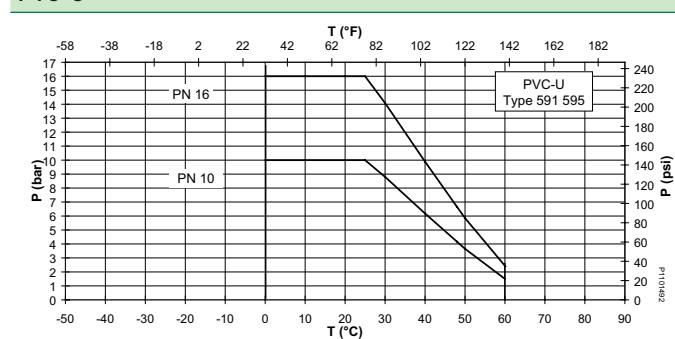

### Specification

<b>Dimensions</b>	d16/DN10 – d110/DN100, $\frac{3}{8}$ " – 4"	
<b>Materials</b>	Valve body	PVC-U, PVC-C, ABS, PP-H, PVDF
	Spring for Type 595	Standard: Nimonic 90 Optional: Nimonic 90 Halar (ECTFE) coated
<b>Gasket materials</b>		EPDM, FKM
<b>Pressure levels</b>	PVC-U, PVC-C, PVDF PP-H, ABS	PN16 PN10
<b>Approvals</b>	ACS, FDA, DIBt, TA Luft, NAMSA	

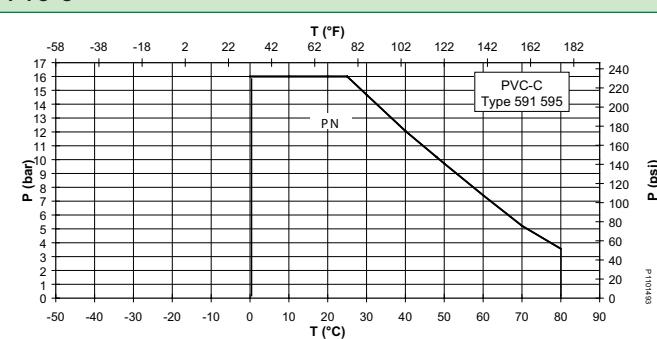

## Pressure-temperature diagrams

The following pressure-temperature diagrams are based on a lifetime of 25 years and water or similar media.

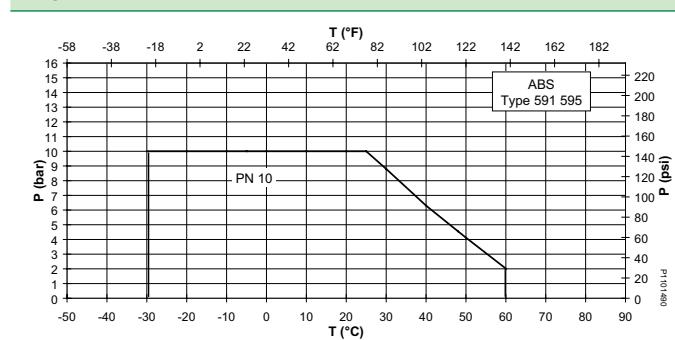

PVC-U

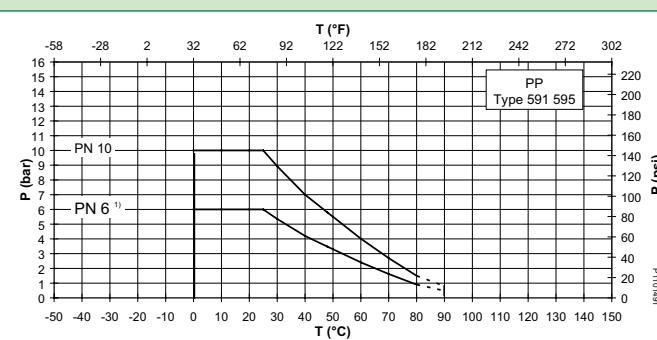

PVC-C

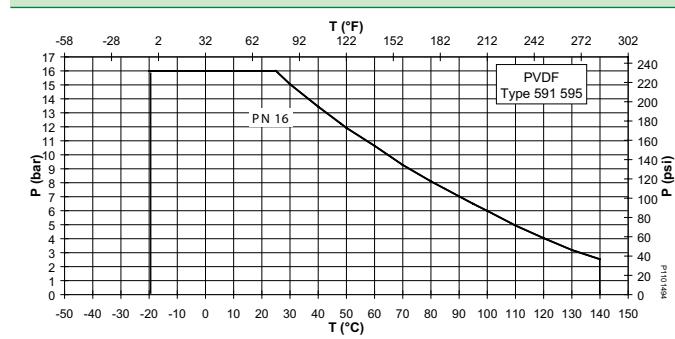

ABS

PP

PVDF

T Temperature (°C, °F)

P Permissible pressure (bar, psi)

<sup>1)</sup> E.g. check valves with PP or PE100 SDR17 butt fusion spigots. For applications in the dotted temperature range, please contact the responsible GF representative.

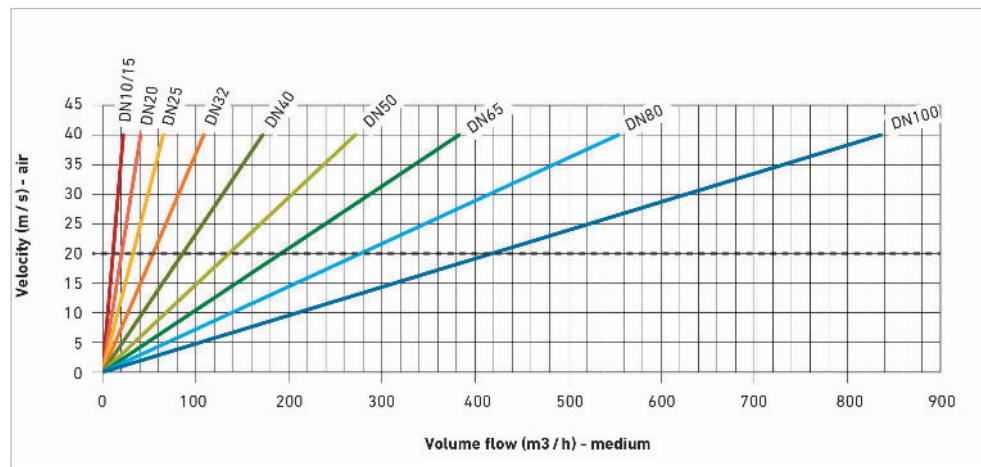

## Calculations for valve configuration

To select the correct valve size, the max. flow ( $Q$  in  $\text{m}^3/\text{h}$ ) is first calculated. To do this, the flow velocity of the medium ( $V_r$  in  $\text{m/s}$ ) is required, as is the inner diameter of the medium-conveying pipe ( $d_i$  in mm).

$$Q = V_r \cdot \pi \cdot \frac{d_i^2}{4} \cdot 0.001 \cdot 3.6$$

The volume flow of the medium can be equated with the gas volume to be discharged or filled. If several aerating or deaerating valves are used, each valve must be configured for the maximum flow velocity. With the calculated volume flow, the correct valve dimension can be determined from the air volume diagram. The velocity in this diagram corresponds to the discharge velocity of the gases at the valve. It is recommended that, if possible, 20 m/s is not exceeded to prevent excessive wear on the valve.

## Air volume diagram

The escape velocity of the air must not exceed 20 m/s.

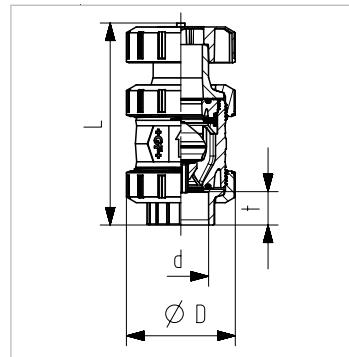

## Pressure for raising cone Type 595

DN (mm)	10	15	20	25	32	40	50	65	80	100
Differential pressure for raising cone (bar)	0.028	0.028	0.030	0.030	0.035	0.040	0.050	0.060	0.060	0.060

## Dimensions

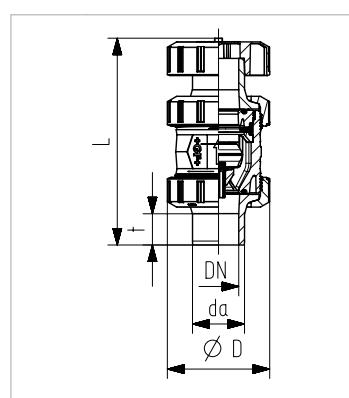

### Type 591, Type 595 with solvent cement sockets, metric

d (mm)	DN (mm)	D (mm)	L (mm)	t (mm)	closest (inch)
